Abstract

This study aims to analyze the influence of psychological well-being on philanthropic behavior within the context of Islamic philanthropy. Psychological well-being, encompassing emotional, cognitive, and social aspects, has been demonstrated to play a significant role in motivating individuals to engage in social and philanthropic activities. Utilizing a qualitative approach through literature review, this research explores the relationship between psychological well-being and philanthropy, with a focus on Islamic religious values such as altruism, social connectedness, and a culture of sharing. Data was collected from various academic sources including articles, books, and scientific publications. The study identifies major patterns indicating that individuals with positive psychological well-being tend to be more involved in philanthropy, particularly through acts such as zakat, sadaqah, and waqf. Thematic analysis reveals that Islamic religious values and social connectivity strongly reinforce individual motivation to participate in philanthropy, which in turn contributes positively to community well-being. This research offers new insights into how psychological and Islamic cultural factors mutually support the strengthening of a sharing culture within Muslim societies and provides important theoretical contributions to the study of Islamic philanthropy and social welfare.

Keywords: Psychological Well-Being, Islamic Philanthropy, Altruism, Sharing Culture, Social Connectedness, Zakat, Sadaqah, Waqf

Introduction

Islamic philanthropy, as a value system within religious teachings, plays a significant role in fostering social and psychological well-being for both individuals and communities (Irham, 2019; Muhammad Deni Putra et al., 2024). A fundamental principle in Islam is generosity through zakat, sadaqah, and waqf, which greatly impacts social quality of life and psychological welfare of individuals and societies. From a social psychology perspective, generosity is

²Universitas Islam Negeri Sultan Syarif Kasim Riau, Indonesia

often linked to enhanced life satisfaction, empathy, and social closeness, which help strengthen community cohesion. Numerous studies indicate that philanthropic activities positively influence mental health and happiness, particularly in cultures that support mutual cooperation and sharing (Post, 2015; Shahid & Ali, 2019). Social psychological research shows that prosocial behavior such as generosity increases feelings of social affiliation and acceptance, contributing to individual and community psychological well-being (Dunn et al., 2008; Aknin et al., 2013). Therefore, Islamic philanthropy and generosity have the potential to improve psychological welfare and reinforce social cohesion within communities.

Despite abundant research on philanthropy and psychological well-being, studies integrating Islamic philanthropy and social psychology remain limited and lack in-depth exploration of their interrelated effects. Most existing research tends to focus on philanthropy from economic or social perspectives alone, without addressing the psychological aspects involved in feelings of happiness and connectedness derived from charitable acts. Prior studies, such as those by Putnam (2000), concentrate on general social engagement, while research specifically focusing on the psychological impact of charity within Islamic religious contexts remains scarce (Chowdhury, 2020; Al-Zu'bi, 2018). Hence, there is a gap in the literature that necessitates comprehensive analysis of the relationship between Islamic philanthropy and psychological well-being, particularly within broader social contexts.

How does Islamic philanthropy, emphasizing values of generosity and mutual cooperation, affect the psychological well-being of individuals and communities? This question is crucial to understanding the dynamics between Islamic religious teachings promoting social care and their effects on mental and social well-being. Accordingly, three primary research questions arise: first, how do philanthropic practices in Islam (zakat, sadaqah, waqf) contribute to enhancing individual psychological well-being? Second, how does Islamic philanthropy influence the strengthening of social cohesion and relationships among community members? Third, what psychological factors mediate the relationship between Islamic philanthropy and community well-being? Addressing these questions could offer broader insights into the benefits of Islamic philanthropy for improving social and mental quality of life and provide a foundation for developing more effective religion-based social policies.

This study argues that generosity in Islam not only affects economic welfare but also plays a highly significant role in enhancing individual psychological well-being and strengthening social bonds within communities. The practice of generosity in Islam fosters social responsibility, which social psychology identifies as a factor that increases happiness through positive social relationships. Islamic philanthropy, by focusing on direct assistance to others and wealth sharing, cultivates empathy and togetherness, which have been shown to yield psychological benefits for the doers (Fowler & Olesen, 2017; Ahmed et al., 2020). In this context, generosity is seen as a principal source in forming healthy social cohesion in society. Thus, understanding this dynamic is vital for designing interventions to improve societal psychological and social welfare holistically at both individual and community levels.

This research was conducted using a qualitative method through literature review, a data collection technique involving analysis of scholarly documents, articles, books, and publications related to the interplay between psychological well-being and philanthropic activities within the context of Islamic philanthropy (A'yun et al., 2022; Mickiewicz et al., 2014). This method was chosen as it enables exploration of deep and complex psychological factors influencing individual motivation to engage in philanthropic activities. The literature review provides opportunities to analyze perspectives and findings from diverse academic sources to understand theories, concepts, and practices related to psychological well-being and their effects on philanthropic involvement (Weiss et al., 2016; Ryff, 2013). The study began by collecting relevant literature from academic databases such as Google Scholar, Scopus, and Web of Science based on criteria of topic relevance, author credibility, and contribution to understanding the link between psychological well-being and participation in philanthropy. Various studies on altruism, social connectedness, mindfulness, as well as literature discussing cultural and religious influences on philanthropic behavior were reviewed in depth. Data analysis was performed using a thematic approach, where the researcher identified and analyzed major patterns emerging from the literature, including altruistic motivation, social connectedness, cultural context, and the role of religion as the basis for philanthropic actions (Azwar et al., 2021; A'yun et al., 2022). This study aims to provide deeper insights on how psychological factors, such as psychological well-being and mindfulness, influence individuals' motivation to partake in philanthropy, and how cultural and religious elements strengthen or moderate

this relationship within Muslim communities. Through this method, the study is expected to contribute theoretical significance to the fields of psychological well-being and philanthropy, and to offer new understanding of how sharing culture and spiritual values can reinforce philanthropic behavior in Muslim societies.

The Impact of Islamic Philanthropic Practices on Individual Psychological Well-Being

The impact of Islamic philanthropic practices on individual psychological well-being is a multifaceted topic encompassing various dimensions, including social, economic, and spiritual aspects. Islamic philanthropy, primarily manifested through zakat, sadaqah, and waqf, plays a significant role in strengthening community solidarity and enhancing the psychological well-being of individuals engaged in these practices. The psychological benefits derived from participation in charitable activities contribute to feelings of fulfillment, life purpose, and social connectedness. Islamic philanthropy is deeply rooted in the principles of compassion and social responsibility. Acts of giving, whether through the obligatory zakat or voluntary sadaqah, are not merely financial transactions but spiritual exercises that reinforce one's faith and connection to the community. Studies indicate that individuals actively involved in philanthropic activities often experience higher levels of happiness and satisfaction, as these actions fulfill intrinsic motivations aligned with their religious beliefs (Amar, 2017; Sarib, 2024; Kurniati, 2024). This intrinsic motivation is further supported by cognitive evaluation theory, which posits that individuals derive satisfaction from engaging in activities congruent with their values and beliefs (Kurniati, 2024).

Moreover, the psychological impact of Islamic philanthropy is felt not only by the givers but also by the recipients of charitable acts. The provision of zakat and sadaqah directly meets the needs of the less fortunate, fostering a sense of community and interconnectedness between donors and beneficiaries. This reciprocal relationship strengthens social cohesion and may lead to improved mental health outcomes for all parties involved. Research has shown that communities with strong philanthropic practices tend to exhibit lower levels of anxiety and depression because individuals feel more supported and connected to one another (Febriandika, 2023; Woodward, 2022). The role of Islamic philanthropic institutions in promoting volunteerism is also highly significant. By creating opportunities for individuals to engage in charitable work, these

institutions not only facilitate resource distribution but also enhance the psychological well-being of volunteers. Studies show that volunteers report higher life satisfaction and lower stress levels, as helping others can provide a sense of purpose and fulfillment (Kurniati, 2024; Febriandika, 2023). Additionally, the motivation to volunteer is often influenced by religious beliefs, which can further augment the psychological benefits associated with charitable activities (Farouk et al., 2018).

Beyond direct psychological benefits, Islamic philanthropy also contributes to long-term well-being by fostering a culture of giving and mutual support. The formation of informal support networks, particularly among Muslim communities, exemplifies how philanthropic practices can create safety nets for individuals facing economic hardship (Woodward, 2022; Akinlabi, 2022). These networks provide not only financial aid but also emotional support, which is crucial for maintaining mental health during difficult periods. The connectedness fostered by these practices can result in more resilient communities capable of collectively addressing social and economic challenges (Akinlabi, 2022). Furthermore, the integration of technology in Islamic philanthropy, such as through digital platforms for zakat and sadaqah, has expanded the reach and efficiency of charitable giving. These technological advancements facilitate the collection and distribution of funds while enhancing transparency and trust in philanthropic institutions. As individuals gain confidence in the effectiveness of their contributions, they tend to experience increased satisfaction and psychological well-being (Ramadhan et al., 2023; Mukhid, 2024). The positive relationship between effective philanthropic practices and individual mental health underscores the importance of maintaining strong, accountable charitable organizations.

The psychological benefits of Islamic philanthropy are also reflected in the broader societal context. By addressing poverty and inequality, zakat and sadaqah contribute to social justice and economic stability, which are essential for creating healthy communities. Research demonstrates that communities with effective philanthropic practices tend to experience lower crime rates, better educational outcomes, and overall improved well-being (Sarib, 2024; Shaikh & Ismail, 2017). This correlation suggests that the psychological benefits of philanthropy extend beyond individual experiences, influencing the collective mental health of communities. Additionally, the spiritual dimension of Islamic philanthropy cannot be overlooked. Involvement in charitable acts is often

viewed as a means to fulfill religious obligations and achieve spiritual growth. The connection between philanthropy and spirituality can enhance an individual's sense of purpose and connectedness, contributing to their overall psychological well-being (Amar, 2017; Aydın, 2015). Giving is frequently accompanied by prayer and reflection, which can further reinforce the spiritual benefits associated with philanthropy.

In conclusion, the impact of Islamic philanthropic practices on individual psychological well-being is profound and multifaceted. Through strengthening social bonds, enhancing life purpose, and fulfilling community needs, these practices significantly contribute to the mental health of individuals and communities alike. The integration of technology and the development of robust philanthropic institutions further amplify these benefits, ensuring that the spirit of giving continues to thrive in contemporary society. As research continues to explore the complex relationships between philanthropy and psychological well-being, it becomes increasingly clear that Islamic charitable practices play a vital role in promoting individual happiness, collective resilience, and social harmony.

The Role of Psychological Well-being in Influencing Philanthropic Activities

The intricate relationship between psychological well-being and philanthropic activities has garnered significant attention in recent years, alongside researchers' efforts to understand how emotional and mental states influence altruistic behavior. Psychological well-being encompasses various dimensions, including emotional, cognitive, and social aspects, which collectively contribute to an individual's functioning and life satisfaction (Indreswari et al., 2022; Weiss et al., 2016). This multifaceted construct is crucial in shaping how individuals engage in philanthropy, as those with higher psychological well-being are often more inclined to participate in charitable activities, driven by intrinsic motivation rather than external pressures (Mickiewicz et al., 2014).

Studies show that individuals with strong psychological well-being exhibit greater empathy and a heightened sense of social responsibility, which are essential components of philanthropic behavior. For instance, research indicates that psychological well-being fosters a sense of purpose and meaning in life, translating into a desire to make positive contributions to society (Ryff, 2013). Moreover, a meta-analysis conducted by Weiss et al. highlights that interventions aimed at enhancing psychological well-being can lead to increased

prosocial behaviors, including philanthropy (Weiss et al., 2016). This suggests that improving psychological well-being not only benefits individuals but also has broader societal implications by promoting charitable giving.

Furthermore, the relationship between psychological well-being and philanthropy becomes clearer through the lens of entrepreneurial orientation. Mickiewicz et al. argue that there is a mutually reinforcing link between goodwill and self-interest, indicating that individuals involved in philanthropic activities often do so as a way to fulfill their psychological needs while simultaneously benefiting others (Mickiewicz et al., 2014). This duality underscores the complexity of motivations behind philanthropic actions, where personal wellbeing and altruism are intertwined. Additionally, the role of mindfulness in enhancing psychological well-being has been explored, revealing that mindfulness practices can significantly improve emotional regulation and overall mental health (Anuar, 2022; Roche et al., 2014). Improvements in psychological states may lead to increased engagement in philanthropic activities, as mindful individuals tend to have heightened awareness of their environment and greater appreciation of others' needs. Therefore, mindfulness can act as a catalyst for philanthropic behavior by deepening connections with community and social issues.

The implications of psychological well-being extend across various demographics, including older adults and adolescents. For example, studies show that older individuals engaged in volunteer work report higher levels of psychological well-being, suggesting that philanthropy can be an important source of fulfillment and purpose in later life (Ho, 2015). Similarly, adolescents experiencing positive psychological states are more likely to engage in prosocial behaviors, including charitable giving (Megawati & Herdiyanto, 2016; Monika, 2023). This highlights the importance of nurturing psychological well-being at different life stages to foster a culture of philanthropy. Besides, the concept of eudaimonic well-being, emphasizing personal potential realization and meaningful life engagement, is highly relevant in understanding philanthropic motivation (Ryff, 2017). Individuals pursuing eudaimonic well-being are often driven by the desire to contribute to the common good, aligning their personal values with their philanthropic efforts. This alignment not only enhances their psychological well-being but also strengthens their commitment to charitable activities.

In the context of community involvement, the role of organized proximity in philanthropy has been examined, emphasizing the importance of social networks in facilitating charitable giving (Glückler & Ries, 2012). Individuals who are part of supportive communities are more likely to experience increased psychological well-being, which in turn motivates them to engage in philanthropic activities. The linkage between community support and individual well-being highlights the need to strengthen social bonds to promote a culture of giving. Moreover, the ethical dimension of philanthropy cannot be overlooked. As discussed by Dilworth, discomfort with philanthropy often arises from concerns about power dynamics and the implications of charitable giving on community well-being (Dilworth, 2021). Addressing these ethical concerns is crucial to ensure philanthropic efforts genuinely contribute to community welfare rather than perpetuating inequality. This requires critical examination of the motivations behind philanthropic actions and their impact on psychological well-being at both individual and community levels.

The relationship between psychological well-being and philanthropic behavior is also influenced by socioeconomic factors. Research indicates that individuals from higher socioeconomic backgrounds often report better psychological well-being, which correlates with greater philanthropic engagement (Baryshev & Irina, 2016). This suggests that addressing disparities in psychological well-being across socioeconomic groups is essential for promoting equitable participation in philanthropy. In conclusion, the interaction between psychological well-being and philanthropic activities is complex and multifaceted. Enhancing psychological well-being through various interventions and practices can lead to increased engagement in charitable activities, benefiting both individuals and society at large. As researchers continue to explore this relationship, it becomes increasingly clear that nurturing psychological well-being is not only important for individual fulfillment but also for fostering a thriving culture of philanthropy.

Psychological Factors Mediating the Influence of Islamic Philanthropy on Community Well-being

The influence of Islamic philanthropy on community well-being is a complex phenomenon that is significantly affected by various psychological factors. These factors include altruistic motivation, social connectedness, and the cultural context within which philanthropy operates. Understanding the

mediating factors in this relationship is crucial for enhancing the effectiveness of philanthropy initiatives aimed at improving community well-being. Altruism is a primary psychological factor driving individuals to engage in philanthropic activities. Studies show that altruism often serves as the main motive behind community welfare programs funded through Islamic philanthropy. For example, A'Yun et al. emphasize that altruistic intentions are often rooted in Islamic teachings, which prioritize helping others and contributing to social welfare (A'yun et al., 2022). This intrinsic motivation fosters a sense of responsibility among individuals to participate in philanthropy, thereby enhancing community well-being. Furthermore, the integration of altruism with local cultural practices can strengthen the impact of Islamic philanthropy. Lidiawati et al. discuss how local cultural values shape practices of zakat, infak, and sadaqah, creating a harmonious community environment that promotes shared welfare (Lidiawati et al., 2023).

Social connectedness is another psychological factor mediating the influence of Islamic philanthropy on community well-being. A sense of belonging and social bonds can significantly increase individuals' willingness to contribute to philanthropic causes. Research by Azwar et al. highlights that Islamic philanthropy is not merely an individual act but is deeply embedded in social networks that promote collective action for poverty alleviation (Azwar et al., 2021). This connectedness creates a supportive environment where individuals feel encouraged to engage in charitable activities, thus improving the overall well-being of the community. Additionally, the role of mosques as centers of philanthropic community activity is indispensable. Irham notes that mosques often function as platforms for sustainable community empowerment through Islamic philanthropy, reinforcing social bonds and collective responsibility (Irham, 2019).

The cultural context also plays a critical role in mediating the relationship between Islamic philanthropy and community well-being. The effectiveness of philanthropic initiatives can vary greatly depending on the values and cultural norms prevalent in a community. For instance, Saputra et al. argue that integrating Islamic philanthropy with social entrepreneurship can create innovative solutions to socioeconomic challenges, particularly when such initiatives align with local cultural practices (Saputra et al., 2021). This cultural congruence not only enhances acceptance of philanthropic activities but also ensures that these efforts are consistent with community values, thereby

maximizing their impact on well-being. Moreover, psychological factors influencing philanthropic behavior are not static; they evolve alongside changing societal dynamics. Farhan discusses how Islamic philanthropic institutions, such as Lazismu, adapt their strategies to meet the evolving needs of communities, thereby promoting social justice and equity (Farhan, 2021). This adaptability is crucial for maintaining the relevance and effectiveness of philanthropic efforts in addressing contemporary community challenges.

The interaction between psychological factors and Islamic philanthropy is further illustrated through the concept of effective altruism. Anugrah critiques the dominant narratives surrounding Islamic philanthropy, suggesting that these narratives often overlook individual obligations in charity arising from personal motivation and social expectations (Anugrah, 2023). This critique highlights the complexity of altruistic behavior, where individual psychological factors, such as personal values and beliefs, interact with broader social and cultural influences. Furthermore, the role of psychological safety in encouraging philanthropic behavior must not be underestimated. Research indicates that individuals are more likely to engage in charitable activities when they feel psychologically safe within their communities. This sense of safety encourages open discussions about philanthropy and enables individuals to express their intentions without fear of judgment. Findings from May underscore the importance of creating supportive environments that foster psychological safety, thereby facilitating greater participation in philanthropic initiatives (May, 2022). The impact of trust in charitable organizations is also a significant psychological factor influencing donation behavior. Studies by Lee and Kim demonstrate that trust dimensions, including perceived competence and integrity, positively affect attitudes and intentions to donate to charitable organizations (Lee & Kim, 2023). This trust is vital for Islamic philanthropic institutions, as it directly influences their ability to mobilize resources and engage community members effectively.

The psychological factors mediating the influence of Islamic philanthropy on community well-being are diverse and interconnected. Altruism, social connectedness, cultural context, psychological safety, and trust in charitable organizations all play important roles in shaping individual philanthropic behavior. Understanding these factors is essential to enhancing the effectiveness of Islamic philanthropy in promoting community well-being. By fostering environments that support these psychological elements, philanthropic

initiatives can achieve greater and more sustainable impacts in addressing community needs.

Spiritual Reinforcement: Islamic Values as Psychological Foundations for Philanthropic Commitment

Islamic philanthropy can be deeply understood through the fusion of Islamic values with psychological bases that encourage charitable dedication. This integration is fundamentally supported by Islamic work ethics, religious duties such as zakat, and broad cultural norms emphasizing altruistic conduct within Muslim societies. Islamic work ethics serve as a key psychological pillar by promoting personal integrity, accountability, and fostering positive workplace culture. Studies like those by Ridwansyah et al. (2023) highlight that Islamic values — such as honesty, generosity, and diligence — significantly contribute to healthy organizational dynamics and employee commitment. The embodiment of these values results in improved organizational citizenship behavior, enhancing cooperation and responsibility among members. Furthermore, Arif et al. (2023) confirm that Islamic work ethics not only elevate job satisfaction but also indirectly drive professional loyalty and philanthropic action, reflecting a holistic approach connecting spirituality, psychology, and social productivity. This foundational role of Islamic ethics shapes the mindset and behaviors that underpin a Muslim's ongoing commitment to giving and social justice, emphasizing that philanthropy within Islam transcends mere obligation to become a moral and organizational virtue.

Central to the philanthropic motivation in Muslim contexts is religious observance, with zakat playing a pivotal role as one of the five Islamic pillars. This compulsory almsgiving is not just a financial act but a profound manifestation of collective responsibility that aims to reduce social inequality and promote welfare across communities (Opoku, 2012). Zakat institutionalizes a systematic approach to charity, embedding it deeply into Muslim identity and practices. Research by Khafagy (2020) reveals that this spiritual obligation cultivates a psychological predisposition in Muslims towards empathy, social solidarity, and humanitarian engagement. Alongside zakat, the concept of sadaqa — voluntary charity — underscores intrinsic philanthropic motivation that extends beyond obligatory giving and fosters continuous community involvement based on Islamic ethics (Chetioui et al., 2022). This voluntary dimension underlines the ethical and heartfelt aspect of Islamic philanthropy,

where personal intention and sincerity in giving are as important as the physical act. The fusion of religious duty and personal ethics creates a powerful dynamic thoroughly embedded in Islamic teachings, driving enduring charitable behaviors within Muslim societies.

Beyond individual contributions, Islamic philanthropic values encourage a culture of collective social responsibility focused on community upliftment. Organizations shaped by these Islamic principles often demonstrate enhanced capacity in mobilizing resources and executing humanitarian missions effectively. Khafagy (2020) discusses how institutions influenced by Islamic teachings foster solidarity, trust, and shared responsibility, enabling a diversified humanitarian approach that aligns with religious values and the communal spirit. This collective ethos not only strengthens organizational reach but also reinforces social cohesion through cooperative charity work. Important too is the role of cultural influencers and community leaders in promoting philanthropy (Alrashdi, 2021), illustrating how cultural dynamics and religious values intertwine to magnify the impact of charitable initiatives. Such influences propel philanthropy beyond private acts into communal norms that shape social expectations and behaviors, making charity instrumental in social development and cohesion within Muslim populations.

Finally, the impact of Islamic ethics extends into modern economic practice, where ethical frameworks based on Islamic principles integrate with contemporary business operations to cultivate sustainable philanthropic strategies. Harti (2024) explains that such integration ensures that charitable giving is not only ritualistic but embedded in a broader ethical economic system that values social responsibility. The modern financial practices influenced by Islamic values emphasize transparency, fairness, and long-term social benefit, promoting philanthropy as a natural component of economic activity. Additionally, Caniago et al. (2023) highlight how Islamic finance mechanisms create enabling environments for ongoing charitable activities by aligning financial incentives with moral considerations. This alignment strengthens the sustainability of philanthropic efforts and reinforces the ethical cycle supporting social welfare. Consequently, the synergy of Islamic work ethics, religious mandates, and cultural norms creates a robust psychological and structural foundation that drives individual and institutional commitment to philanthropy for the well-being of Muslim communities and society at large.

Conclusion

This study shows that psychological well-being plays a crucial role in encouraging individuals to participate in philanthropic activities, particularly within the context of Islamic philanthropy. Psychological well-being, encompassing emotional, cognitive, and social aspects, is proven to have a significant relationship with individuals' motivation to engage in acts of generosity. Within the Islamic framework, concepts such as altruism, social solidarity, and social connectedness act as primary drivers in philanthropic practices, including zakat, sadaqah, and waqf. Consequently, individuals with good psychological well-being tend to be more open to giving because they feel a greater life purpose and a deep social connection with their community. Moreover, this study also highlights the importance of religious values in motivating philanthropic behavior. Islam, with teachings on social responsibility, generosity, and distributive justice, underpins charitable practices that focus not only on personal gain but also on contributions to community welfare. The integration of religious values and individual psychological conditions creates a strong synergy to reinforce a culture of sharing within Muslim communities. Psychological well-being and Islamic philanthropy mutually strengthen each other in building a healthy and sustainable social ecosystem. Therefore, efforts to enhance individuals' psychological well-being—through social interventions or religious-based programs—can be an effective strategy to strengthen the culture of sharing and support broader social goals. This study significantly contributes to the understanding of how psychological well-being and local values can enhance the effectiveness of philanthropic practices in Muslim societies.
